

THE COMPUTER ARCHITECTURE

What is CPU?

It is the brain of the computer. CPU means Central Processing Unit. It is the part of computers that processes data and executes software commands. The main task of the CPU is to manage all the hardware by controlling the connection between software and hardware.

What is RAM?

Ram means Random Access Memory. RAM is a type of memory where the informations are temporarily stored. The main task of RAM is to make computer systems run faster. The data directly on the RAM is passed through this filter and delivered to the main memory. So the more powerful the RAM will make the computer system faster.

What is HDD?

It means Hard Disk Drive. It is a permanent storage of the computer. We can save all the informations in it.

What is BUS?

It is a system that carries the informations between all the components. It is a connection between software and hardware.
